## **COUNTY TRADE PULL FACTORS Annual report for fiscal year 2007**

(July 2006 – June 2007)

Kansas Department of Revenue Office of Policy and Research Issued May 2008

## Introduction

This is the 3rd year for the Kansas Department of Revenue to publish the County Trade Pull Factor report. The Kansas State University's Department of Agricultural Economics prepared prior reports. The report was the effort of David Darling, Ph. D and with his recent retirement, the department assumed the publication of the pull factor report.

The County Trade Pull Factor report provides different measures of retail market data for the 105 Kansas counties for fiscal year 2007, which represents the period July 1, 2006 through June 30, 2007. Retail market data is presented three ways.

- The first measure is a location quotient of retail trade called the *County Trade Pull Factor* (CTPF). It is a measure of the relative strength of the retail business community. The County Trade Pull Factor is computed by dividing the per capita sales tax of a county by the statewide per capita sales tax. A CTPF of 1.00 is a perfect balance of trade. The purchases of county residents who shop elsewhere are offset by the purchases of out-of-county customers. CTPF values greater than 1.00 indicates that local businesses are pulling in trade from beyond their home county border. Thus, the balance of trade is favorable. A CTPF value less than 1.00 indicates more trade is being lost than pulled in, that residents are shopping outside the county. This is an unfavorable balance of trade.
- The *Trade Area Capture* (TAC) of a county is a measure of the customer base served by a community. It is calculated by multiplying the county's population by the CTPF.
- The *Percent Market Share* (MS) is the percent the county's Trade Area Capture is of the state as a whole. TAC is calculated by dividing the county's TAC by the sum of all 105 county TAC numbers.

Prior year reports and other community related reports and can be found (or linked) at the Department of Revenue's web site, <u>www.ksrevenue.org</u> or at the Kansas State University's web site, <u>www.agecon.ksu.edu/ddarling/d2002/dhome.html</u>

## Discussion

Tables 1 and 2 list the measures for each county. In Table 1 the report is sorted alphabetically by county. Table 2 is sorted by pull factor in descending order.

#### County Trade Pull Factor (CTPF)

Eighteen counties have a positive pull factor measure of 1.0 or greater, compared to 17 counties in fiscal year 2006. The county with the highest trade pull factor is Pottawatomie

County with a CTPF of 1.52. The high pull factor in Pottawatomie County can be attributed to a relatively low population base and the strong retail presence that exists within the county's portion of the city of Manhattan. Ellis County, has the 2nd highest pull factor of 1.51, the increase was due to an increase in state tax collections with the population remaining constant. Thomas County has the 3<sup>rd</sup> highest pull factor of 1.40, with Ness County and Johnson County tied at 4<sup>th</sup> with pull factors of 1.35. Johnson County makes up 19% of the population and 26% of the retail trade in the state of Kansas. As part of the greater Kansas City metropolitan area, it not only attracts shoppers from other Kansas counties but Missouri residents as well.

The remaining 13 counties with a CTPF greater than 1.0 are regarded as regional retail centers. Each contains one or more cities that draw shoppers into their county. They generally have large national chain stores that provide goods that may not be available in neighboring counties. Many also have higher education institutions or regional businesses that bring people into the county.

There are 12 counties with a trade factor of 0.40 or less (the same as in FY 2006), indicating that the county's residents do more of their shopping outside the county than within. Eight of the counties neighbor a positive CTPF county. Of the remaining 6 counties with a low CTPF, six are border counties and have access to trade centers in a neighboring state. The remaining county, Chase County is situated between Topeka and Wichita and has Lyon County, home of Emporia to its east. Some of the low CTPF counties, such as Jefferson and Wabaunsee, are considered bedroom counties of a neighboring county and the residents in these counties would tend to shop where they work.

As done for the previous reports, the state of Kansas has been divided into eleven (11) regions. These regions are the ones used in the Governor's Economic Development Reporting. By adopting these regions for the pull factor report, comparisons with other economic reports can be easily made.

When the CTPF is reviewed by region, nine of the 11 regions have at least one county with a positive pull factor. Map 1 provides the county trade pull factors for each county. The two regions that do not have at least one county with a positive CTPF are regions XI (northeast) and II (southeast). Neosho County, 2009 in Region II, had a positive pull factor in FY 2009 dropped to 0.99 in FY 2007. The primary reasons for region XI to not have a county with a positive CTPF is the proximity to regional shopping centers such as Topeka, Manhattan, and St Joseph Mo.

#### Trade Area Capture (TAC)

The *Trade Area Capture* of businesses in all 105 Kansas counties is the 2<sup>nd</sup> measure provided on the tables. TAC is calculated by multiplying the county's adjusted population figure by their corresponding CTPF. The TAC value is an estimate of the actual size of the customer base served by local businesses. Thus, the TAC value is an

absolute one as compared to the pull factor, which represents a relative value. The TAC value estimates the size of the local market, identifying the number of shoppers that the county supports. The CTPF should be used to estimate the relative strength of the business community, not the absolute strength. For example, Allen County has a TAC of 10,043 customers (calculated by multiplying the county population of 13,488 by their CTPF of 0.75). By comparison, Johnson County has the highest TAC, followed by Sedgwick County. Respectively, their customer bases are 690,098 and 544,052. This is expected since they are the two largest population counties in the state.

Conversely, the counties with the lowest pull factor measure also have low trade area capture measures. The existing retail businesses in these counties do not support the overall retail needs of their residents. This could be due to the lack of a customer base to support the type of retail missing in the community or the lack of necessary retailers to draw in a customer base.

#### Percent Market Share (MS)

The *Percent Market Share* (MS) measures the percent of the total customer base in Kansas captured by the retail county's retail businesses. The total customer base is calculated by dividing the county's trade area capture by the total TAC for all counties. The MS is presented as a percentage. Thus, Johnson County controls 25.4% of the Kansas market. Sedgwick County controls 20.0%.

### **Changes from prior years**

<u>Table 3</u> provides the change in the three measures from fiscal year 2006. Generally, all three measures will move in the same direction. If the percent change in CTPF is negative, the trade area capture and market share will also be negative. If the percent change in CTPF is relatively high, the counties trade area capture and market share will also show significant increase. There are a few exceptions, but the amount of variance is slight.

<u>Table 4</u> provides the change in the three measures over a five (5) year timeframe, from fiscal year 2003 to fiscal year 2007. This table was developed to see if any trends could be identified due to the effect of destination sourcing (see the policy implications discussion below). Prior to fiscal year 2004, the measures did not change significantly in their values from year to year. Beginning with fiscal year 2004 some counties have had significant changes. Map 2 highlights the counties with 10% or more change in all three measures during the 5-year period. There were 53 counties with positive increases in all three measures of 10% or more, and of these, 42 had increases in excess of 15%. In some instances, these are smaller population counties, and a small increase in sales results in significant increases in the measures. A few of the counties, such as Russell and Comanche, are moving towards becoming trade centers as their pull factors approach a value of 1.0. A growing number of counties with increasing measures are those near a trading center, and those increases may be due to destination sourcing. Likewise, there were 10 counties with decreases in all three measures, although none exceeded a -10% or

more in all three categories. The counties with negative change are mostly trade center counties, which would coincide with the increases being seen in their neighboring counties. This would add credence to the theory that destination sourcing may be influencing the pull factors.

### **Policy Implications**

In 2003 the Kansas Legislature passed a law that placed Kansas in conformity with the Streamlined Sales Tax Agreement. Part of the legislation required Kansas to enforce destination sourcing. Destination sourcing requires retail businesses to collect sales tax based on the place where the customer takes delivery of a purchase. Vehicle purchases are excluded from the sourcing requirement. Prior to the change, only telecommunications and utility sales were taxed in this manner. Full reporting of destination sourcing was not required until January 2005; therefore the impact could not be fully studied until now.

Destination sourcing results in charging the sales tax based on where delivery occurs, and in some industries this affects how sales are recorded. For instance with furniture retailers, if the furniture is delivered to the purchaser's home, the sale is recorded as occurring at the taxing jurisdiction of the purchaser. The primary retailers affected by destination sourcing are those in furniture, home improvement (lumber), household and electronic appliances, and certain repair services.

Destination sourcing affects the county trade pull factors as the measure is based on sales tax collections. Prior to the new law, all sales of a retailer were recorded based on the business location. With destination sourcing, sales that are delivered are recorded where the delivery occurred. If the sale were into a neighboring county, it would be recorded as such – resulting in a loss of sales tax collections in the county where the store is located. The overall impact of destination sourcing on a county's total sales has not been significant, so determining whether a change in county sales tax collections as a direct result of destination sourcing is challenging. If only the statewide increase to individual counties is considered, there are several trade centers with increases less than the statewide gain. In fiscal year 2007, state sales tax collections increased by 3.8%. Counties with a positive CTPF that did not meet or exceed this rate of increase include Barber (3.1%), Johnson (2.0% increase), Shawnee (0.7% increase), Sherman (0.1%), Reno (2.9%, and Saline (3.6%). In contrast, sales tax collections increased well above the statewide percentage in some counties that have low CTPF measures, such as Decatur (13.1%), Gray (10.1%), Jewell (13.0%), Rawlins (10.1%), and Wilson (11.1%). Further study of the sales tax data, the changes in collections, either positive or negative, will be performed to determine if the changes can be directly tied to destination sourcing. For those who rely on CTPF reports, destination sourcing affects the pull factor measure in that the measure may be somewhat less meaningful under the new tax policy. The department continues to monitor the impact of sourcing.

It should also be noted that Geary and Riley County are experiencing significant population changes due to the Fort Riley growth. Much of the population change is not represented in this year's report.

Clark County had significant changes in all three of the measures for fiscal year 2007. This increase is due to a major construction project.

### FY 2006 Data Sources

The data used in this report consists of county population and state sales tax collections. The county population estimates are from the U.S.Census Bureau as certified by the Division of the Budget July 1, 2007 and published as the official population reports for the state of Kansas, adjusted to remove the institutionalized population. The institutionalized population does not trade within the retail community, so should not impact the computing of the measures. People in jails, prisons, and nursing homes are part of the institutionalized population. To arrive at the adjusted population data for this report, the 2000 U.S. Census Bureau's institutionalized population has been subtracted from the 2006 population by county data with adjustments made for changes in state and federal prison populations. Appendix A lists the county populations. The Census counts are published on their web site: www.census.gov.

State sales tax collections are generated by the Department of Revenue from sales tax returns filed by the state's retailers. The department has improved the data series used for this report. In the past, more than \$200 million was unallocated. This meant that the data user did not have any idea where these sales tax revenues originated. Thus, the prior reports were less accurate. For FY 2007, all but \$7.1 million in sales tax revenue were allocated to counties compared to \$6.0 million in FY 2006. Appendix B lists the state sales tax collections for fiscal years 2006 and 2007. Sales tax reports issued by the department are available on their web site at http://www.ksrevenue.org
